### SOREL Presents Elegant Room Controller °CALEON

Just in time for the upcoming MCE in Milano, SOREL presents their new room controller °CALEON, which provides a convenient way to influence the weather-compensated heating controllers HCC. "Given that °CALEON was designed for use by the end customer from his living space, we focused on two aspects: a classy look and the user-centered, intuitive operator guidance which is so typical for us", as CEO Jonas Bicher points out. To achieve this, SOREL combines a capacitive TFT colour touch display with a front glass panel and a white designer housing, which sends out a feeling of simple elegance.

It is possible to link up to 8 °CALEONs to any heating circuit. By selecting among the 4 operating modes Regular, Eco, Turbo and Off as well as the remarkably easy setting of heating times, individual temperature profiles can be arranged for every room. "That saves energy and increases the comfort of living at the same time", Bicher says. In this way, the HCC controllers with °CALEON satisfy the highest ErP class VIII for temperature controls.

Moreover, the integrated temperature and humidity sensor provides the user with valuable insights about the climatic conditions in the living space. Whenever an outdoor sensor is connected, it transmits its information to °CALEON as well. It is also possible to link °CALEON to SOREL Connect for remote controlling the heating comfortably by smartphone app, and to combine it with the future °CALEONBox for surface heatings with up to 8 zones.

°CALEON will be featured together with additional news about SOREL's heating, solar thermal and fresh water controllers at MCE in hall 4, stand R07.
